

Data Flow Diagram

1. Introduction

This document presents the Data Flow Diagrams (DFD) for the Laundry Shop Management System. The diagrams illustrate how data flows between external entities, system processes, and data stores based on the revised Functional Decomposition Diagram (FDD) and validated requirements.

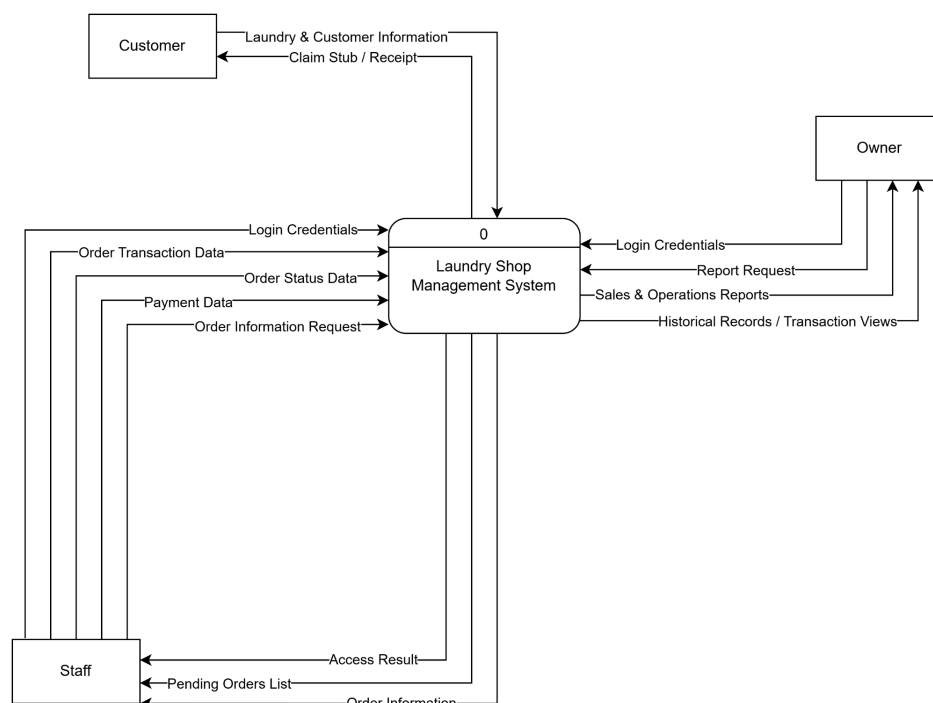

The DFD reflects only the approved system scope and directly addresses the operational problems identified during the client interview and observation.

2. Purpose of the DFD

The DFD is intended to:

- Represent how data moves through the system
- Show interactions between users, processes, and data stores
- Ensure alignment with revised functional requirements and FDD
- Serve as a foundation for the Entity Relationship Diagram (ERD)
