

Process Matrix

1. Introduction

This document presents the Process Matrix for the Laundry Shop Management System. It compares the current manual business processes (AS-IS) with the proposed system-supported processes (TO-BE) based strictly on findings from the client interview and on-site observation.

The purpose of this matrix is to clearly identify operational inefficiencies in the existing processes and define how the proposed system will address these issues without exceeding the approved project scope.

2. Purpose of the Process Matrix

The Process Matrix is used to:

- Document the actual day-to-day operations of the laundry shop
- Identify pain points caused by manual processes
- Define realistic improvements aligned with stakeholder needs
- Serve as the basis for functional requirements, DFDs, and system design

3. Identified Core Business Processes

Based on the interview and observation, the following core business processes were identified:

1. Customer Laundry Intake
2. Laundry Order Recording
3. Laundry Status Tracking
4. Payment Recording and Verification
5. Laundry Release / Pickup
6. Sales and Operational Reporting

4. AS-IS vs TO-BE Process Matrix

4.1. Customer Laundry Intake

Aspect	AS-IS (Current Manual Process)	TO-BE (Proposed System Process)
Customer arrival	Customer physically brings laundry to the shop	Same
Laundry weighing	Staff weighs laundry using a weighing scale	Same
Service discussion	Service type discussed verbally	Service selected and recorded in the system
Data recording	Details written manually in a logbook	Order details entered into the system
Order reference	Handwritten claim stub issued	System-generated order reference number

4.2. Laundry Order Recording

Aspect	AS-IS	TO-BE
Order details	Written in a logbook	Stored digitally in a centralized database
Data accuracy	Prone to handwriting and calculation errors	Input validation reduces errors
Record retrieval	Manual searching through notebooks	Fast search using order reference or customer name
Record retention	Limited (3–6 months)	Digital records retained for reference

4.3. Laundry Status Tracking

Aspect	AS-IS	TO-BE
Tracking method	Physical tags, staff memory, logbook	Status tracked in the system
Status visibility	Unclear during peak hours	Clear, up-to-date order status

Laundry Shop Management System | Process Matrix

Error risk	Risk of mixed or delayed orders	Reduced through status indicators
Pending orders	No consolidated list	System-generated pending orders list

4.4. Payment Recording and Verification

Aspect	AS-IS	TO-BE
Payment timing	Usually upon pickup	Same
Payment recording	Written in a separate notebook	Recorded digitally and linked to order
Payment verification	Manual checking of notebooks	System indicates paid/unpaid status
Error risk	Forgotten or duplicate payment entries	Reduced through order–payment linkage

4.5. Laundry Release / Pickup

Aspect	AS-IS	TO-BE
Pickup verification	Claim stub and manual checking	Order lookup via system
Status confirmation	Manual logbook check	System confirms “Ready” status
Payment confirmation	Manual memory/notebook check	System-enforced payment verification
Release update	No formal status update	Order marked as “Released” in system

4.6. Sales and Operational Reporting

Aspect	AS-IS	TO-BE
Daily sales	Manually computed	Automatically generated report
Monthly income	Requires reviewing notebooks	System-generated monthly report

Laundry Shop Management System | Process Matrix

Pending orders	No clear overview	Real-time pending orders list
Historical data	Limited and fragmented	Centralized digital records
