

Functional Decomposition Diagram

1. Introduction

This document presents the revised Functional Decomposition Diagram (FDD) for the Laundry Shop Management System. The FDD organizes system functionality into major functions and sub-functions based on validated requirements and the proposed TO-BE processes derived from the client interview and observation.

The FDD provides a logical functional structure that will guide the DFD and ERD and prevent scope creep by clarifying system boundaries.

2. Purpose of the FDD

The FDD is created to:

- Break down system scope into manageable functional modules
- Ensure full coverage of the revised functional requirements
- Establish a foundation for DFD (process modeling) and ERD (data modeling)
- Enforce scope boundaries (no online booking, no online payments, no inventory, no multi-branch)

3. System Overview

The system will support daily laundry shop operations by providing a centralized way to:

- Record laundry orders and customer details
- Track laundry status across processing stages
- Record and verify payments linked to orders
- Support laundry release/pickup verification
- Generate basic reports (daily sales, monthly income, pending orders)

Laundry Shop Management System | Functional Decomposition Diagram

These functions directly address the key issues identified in the interview:
manual tracking confusion, payment uncertainty, and lack of quick reporting.
